    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 152: Lockwood Drive at McKinney Street
    - The traffic signal at this intersection will be removed as part of the University Line BRT Project.
    - Through movements along McKinney Street will no longer be allowed. The NB and SB approaches to the intersection will be converted to right-in/right-out entrances only.

- 153: Lockwood Drive at Harrisburg Boulevard
    - The NB and SB approaches will both consist of one exclusive left turn lane and a shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - The existing Light Rail Pre-Emption for the METRO Green Line will remain in place at this intersection following the construction of the University Line BRT.

- Proposed BRT will operate through the intersection along with the adjacent NB/SB through movements.
- South of this intersection, the Proposed BRT will operate in a guideway underpass below an existing UPRR crossing and will come back to grade at this intersection.

- 154: Lockwood Drive at Canal Street
  - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one exclusive left turn lane and a shared through / right turn lane.
  - The lane configurations for the EB approach will remain in place except for removal of the exclusive right turn lane following the construction of the University Line BRT Project. The WB approach was restriped to include an exclusive left turn lane and a shared through / right turn lane.
  - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 155: Lockwood Drive at Navigation Boulevard
  - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB approach will consist of an exclusive left turn lane and a shared through / right turn lane. The SB approach will consist of an exclusive left turn lane, and a shared through / right turn lane.
  - One exclusive left turn lane will be removed on the EB approach since only one receiving lane will remain on Lockwood Drive following the construction of the University Line BRT Project. All other existing lanes will remain as is.
  - The lane configuration for the WB approach will remain in place following the construction of the University Line BRT Project.
  - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 197: Lockwood Drive at Marron Park Way
  - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB approach will consist of one exclusive left turn lane and one exclusive through lane. The SB approach will consist of one exclusive U-turn lane and a shared through / right turn lane.
  - The EB approach will consist of an exclusive left turn lane and an exclusive right turn lane.
  - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 156: Lockwood Drive at Armour Drive
  - Existing traffic signal at intersection to be removed as part of this project. Left turn movements from Armour Drive will no longer be allowed. The east leg of the intersection will be converted to a right in / right out roadway intersection.

- 514: Lockwood Drive at Harvey Wilson Drive
    - Traffic signal to be installed at this intersection.
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will consist of an exclusive left turn lane and a shared through / right turn lane.
    - The EB approach will consist of one lane for all traffic movements. The WB approach will consist of an exclusive left turn lane and an exclusive right turn lane.
    - The entrance on the west side of this intersection is an entrance to a COH facility which sees little traffic from this access point and has a gate across it. It is not anticipated that through traffic in the EB and WB directions will be present at this intersection.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 157: Lockwood Drive at Clinton Drive
    - The NB and SB approaches will consist of one exclusive left turn lane, one exclusive through lane, and a shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate in an elevated guideway above grade at this intersection and will not interact with the traffic signal at this location.

8.4.2 Segment 4 Traffic Demand Adjustments

As discussed in further detail in section 3.2.1 of this report, a reduction of through traffic on Lockwood Drive of 10% was assumed following the opening of the proposed University Line BRT due to the reduction in capacity on this roadway and the availability of parallel routes with excess capacity. Long range travel demand modeling was performed both with and without the proposed University Line BRT Project in place, which showed that a portion of the through traffic on Lockwood Drive would shift to either Hirsch Road or Wayside Drive within the limits of Segment 4.

8.4.3 Segment 4 2030 Build Traffic Analysis Results

Table 28 shows the results of the traffic analysis which was performed for the AM and PM peak hours at each of the intersections within the study area of Segment 4 for the 2030 Build conditions. The table also includes the 2030 No-Build traffic analysis results for a comparison to the 2030 Build conditions.

Table 28: 2030 Build Conditions LOS Analysis Results – Segment 4

There are several intersections located within Segment 4 which are projected to operate at an overall LOS of D or better during the peak hours for the No-Build conditions, but due to the changes from the University Line BRT Project, they will operate at a LOS of E or F in the Build conditions. They include the following:

- 150 – Lockwood Drive at Leeland Street (AM peak)
- 153 – Lockwood Drive at Harrisburg Boulevard (PM Peak)
- 154 – Lockwood Drive at Canal Street (PM peak)
- 197 – Lockwood Drive at Marron Park Way (AM peak)

All other intersections in Segment 4 are projected to operate at a LOS of D or better during the peak hours after the proposed University Line BRT is in operation.

8.5 Segment 5

The proposed University Line BRT will be center running throughout the limits of Segment 5. Segment 5 runs along Lockwood Drive, Tidwell Road, and Jensen Drive before accessing the Tidwell Transit center at the northern terminus of the proposed University Line BRT Project.

In several areas of Segment 5, the proposed BRT guideway will be constructed above grade on new elevated structures including the following locations:

- Lockwood Drive from South of Shreveport Boulevard to south of Denmark Street
- Tidwell Drive from east of Hirsch Road to east of Friendly Road

8.5.1 Segment 5 Geometric and Traffic Signal Adjustments

The following adjustments are proposed at each of the intersections within Segment 5:

- 158: Lockwood Drive (SB) at Market Street
  - The proposed BRT lane at this intersection will be constructed in the existing median adjacent to the existing SB lanes.
  - The SB approach will consist of a shared through / left turn lane and a shared through / right turn lane.
  - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
  - An exclusive BRT phase will be added at this for the BRT through movements since the rest of the interchange will be operating with TTI 4-phase hybrid phasing.

- 159: Lockwood Drive (NB) at Market Street
  - The proposed BRT lane at this intersection will be constructed in the existing median adjacent to the existing NB lanes.
  - The NB approach will consist of a shared through / left turn lane and a shared through / right turn lane.
  - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.

- An exclusive BRT phase will be added at this for the BRT through movements since the rest of the interchange will be operating with TTI 4-phase hybrid phasing.

- 160: Lockwood Drive (SB) at IH-10 EB Frontage Road
  - One lane will be removed on the SB approach to the intersection and converted to the exclusive BRT lane as part of the University Line BRT Project. The SB approach to the intersection will include a shared through / left turn lane and one exclusive through lane.
  - The lane configurations for the EB approach will remain in place following the construction of the University Line BRT Project.
  - An exclusive BRT phase will be added at the interchange of Lockwood Drive and IH-10 to accommodate the through movements for the BRT vehicles.

- 161: Lockwood Drive (NB) at IH-10 EB Frontage Road
  - One lane will be removed on the NB approach to the intersection and converted to the exclusive BRT lane as part of the University Line BRT Project. The NB approach to the intersection will include an exclusive through lane and a shared through / right turn lane.
  - The lane configurations for the EB approach will remain in place following the construction of the University Line BRT Project.
  - An exclusive BRT phase will be added at the interchange of Lockwood Drive and IH-10 to accommodate the through movements for the BRT vehicles.

- 162: Lockwood Drive (SB) at IH-10 WB Frontage Road
  - One lane will be removed on the SB approach to the intersection and converted to the exclusive BRT lane as part of the University Line BRT Project. The SB approach to the intersection will include an exclusive through lane and a shared through / right turn lane.
  - The lane configurations for the WB approach will remain in place following the construction of the University Line BRT Project.
  - An exclusive BRT phase will be added at the interchange of Lockwood Drive and IH-10 to accommodate the through movements for the BRT vehicles.

- 163: Lockwood Drive (NB) at IH-10 WB Frontage Road
  - One lane will be removed on the NB approach to the intersection and converted to the exclusive BRT lane as part of the University Line BRT Project. The NB approach to the intersection will include a shared through / left turn lane and one exclusive through lane.
  - The lane configurations for the WB approach will remain in place following the construction of the University Line BRT Project.
  - An exclusive BRT phase will be added at the interchange of Lockwood Drive and IH-10 to accommodate the through movements for the BRT vehicles.

- 164 & 165: Lockwood Drive at Lyons Avenue
    - The exclusive left turn lanes on the NB and SB approaches to the intersection will be removed as they will be impacted by the proposed BRT lane for the University Line BRT Project. The NB and SB approaches will consist of one shared through / left turn lane and one shared through / right turn lane.
    - The WB approach will consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configuration for the EB approach will remain in place following the construction of the University Line BRT Project.
    - An exclusive BRT phase will be added to the intersection for the BRT through movements which will operate when a BRT vehicle is present. This is necessary due to the presence of permitted left turn movements on the NB and SB approaches.

- 534: Lockwood Drive at Hershe Street
    - Intersection to be signalized as part of the University Line BRT Project.
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one shared through / left turn lane and one shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Since there are no exclusive left turn lanes, an exclusive BRT phase was used at this intersection for the BRT vehicles to travel through the intersection. This will allow for the permitted left turns on the NB and SB approaches.

- 166: Lockwood Drive at Mulvey Street
    - Existing traffic signal to be removed at this location and cross-street approaches to be converted to right-in / right-out only.

- 567: Lockwood Drive at Nichols Street
    - Traffic signal to be installed at this intersection.
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one shared through / left turn lane and one shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Since there are no exclusive left turn lanes, an exclusive BRT phase was used at this intersection for the BRT vehicles to travel through the intersection. This will allow for the permitted left turns on the NB and SB approaches.

- 576: Lockwood Drive at Sudan Street
    - Traffic signal to be installed at this intersection.
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 167: Lockwood Drive at Collingsworth Street
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 168: Lockwood Drive at Crane Street
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 169: Lockwood Drive at Cavalcade Street
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 170: Lockwood Drive at Rand Street
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 604: Lockwood Drive at Pardee Street
    - Traffic signal to be installed at this intersection.
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 171: Lockwood Drive at IH-610 EB Frontage Road
    - Existing lanes under the IH-610 overpass which are currently hatched out will be restriped to allow for traffic at the interchange. This will allow for the existing geometry for the general purpose lanes to remain in place following construction of the University Line BRT Project except for the SB approach, which will be restriped to include a shared through / left turn lane and an exclusive through lane.
    - An exclusive BRT phase will be provided at this interchange for the BRT vehicle to travel through the interchange without any conflicts.

- 172: Lockwood Drive at IH-610 WB Frontage Road
    - Existing lanes under the IH-610 overpass which are currently hatched out will be restriped to allow for traffic at the interchange. This will allow for the existing geometry for the general purpose lanes to remain in place following construction of the University Line BRT Project except for the SB approach which will consist of two exclusive through lanes and a channelized right turn lane.
    - An exclusive BRT phase will be provided at this interchange for the BRT vehicle to travel through the interchange without any conflicts.

- 173: Lockwood Drive at Kelley Street
    - One lane will be removed on the SB approach to the intersection for conversion to an exclusive BRT lane. The NB approach will consist of one exclusive left turn lane, one exclusive through lane, and an exclusive right turn lane. The SB approach will consist of one exclusive left turn lane and a shared through / right turn lane.

- The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
- Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 174: Lockwood Drive at Shreveport Boulevard
  - One through lane will be removed on the NB and SB approaches due to the location of the elevated BRT bridge structure. The NB and SB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
  - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
  - Proposed BRT will not interact with the traffic operations at this intersection since it will be on the elevated BRT structure.

- 175: Lockwood Drive at Bennington Street
  - One through lane will be removed on the NB and SB approaches due to the location of the elevated BRT bridge structure. The NB approach will consist of one exclusive left turn lane and one through lane. The SB approach will consist of one shared lane for all movements.
  - The lane configurations for the EB approach will remain in place following the construction of the University Line BRT Project.
  - Proposed BRT will not interact with the traffic operations at this intersection since it will be on the elevated BRT structure.

- 623: Lockwood Drive at Denmark Street
  - Traffic signal to be installed at this intersection.
  - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one lane for all movements.
  - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
  - An exclusive BRT phase will be provided at this interchange for the BRT vehicle to travel through the interchange without any conflicts.

- 176: Lockwood Drive at Crosstimbers Street
  - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
  - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
  - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 177: Lockwood Drive at Weaver Road
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 641: Lockwood Drive at Keeland Street
    - Traffic signal to be installed at this intersection.
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist one exclusive left turn lane and one shared / through right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 178: Lockwood Drive at Laura Koppe Road
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 659: Lockwood Drive at Firnat Street
    - Traffic signal to be installed at this intersection.
    - One through lane will be removed on the NB and SB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The NB and SB approaches will both consist one exclusive left turn lane and one shared / through right turn lane.
    - The lane configurations for the EB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent NB/SB through movements.

- 179: Lockwood Drive at Tidwell Road
    - The exclusive left turn lane on the EB approach to the intersection will be removed. The EB approach will include one shared through / left turn lane and one shared through / right turn lane.
    - The exclusive left turn lane on the NB approach will be removed. The NB approach will consist of a shared through / left turn lane and an exclusive right turn lane.
    - The lane configurations for the SB and WB approaches will remain in place following the construction of the University Line BRT Project.
    - An exclusive BRT phase will be added to the intersection with all other traffic stopping since this is an intersection where the BRT vehicles will turn from one roadway to another. During this phase, the BRT will make the NB left turn movement and/or the EB right turn movement.

- 180: Tidwell Road at Hirsch Road
    - The lane configurations on the approaches to this intersection in all directions will match existing following the construction of the proposed BRT as it will be elevated at this location. As a result, the proposed BRT will not interact with the traffic signal at this location.

- 677: Tidwell Road at Friendly Street
    - Traffic signal to be installed at this intersection.
    - The existing medians and portions of existing left turn lanes will be removed on the EB and WB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The EB and WB approaches will both consist of one exclusive left turn lane, one exclusive through lane, and one shared through / right turn lane.
    - The lane configurations for the NB and SB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent EB/WB through movements.

- 181: Tidwell Road at IH-69 NB Frontage Road
    - One through lane will be removed on the EB and WB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The WB approach will consist of two exclusive through lanes and a shared through / right turn lane. The EB approach will consist of an exclusive left turn lane, a shared through / left turn lane, and an exclusive through lane.
    - The lane configurations for the NB approach will remain in place following the construction of the University Line BRT Project.
    - An exclusive BRT phase will be added at the interchange of Tidwell Road and IH-69 to accommodate the through movements for the BRT vehicles.

- 182: Tidwell Road at IH-69 SB Frontage Road
    - One through lane will be removed on the EB and WB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The EB approach will consist of three exclusive through lanes and a channelized right turn lane. The WB

approach will consist of an exclusive left turn lane, a shared through / left turn lane, and an exclusive through lane.
    - The lane configurations for the SB approach will remain in place following the construction of the University Line BRT Project.
    - An exclusive BRT phase will be added at the interchange of Tidwell Road and IH-69 to accommodate the through movements for the BRT vehicles.

- 689: Tidwell Road at Edell Street
    - Traffic signal to be installed at this intersection.
    - One through lane will be removed on the EB and WB approaches and converted to an exclusive BRT lane as part of the University Line BRT Project. The EB and WB approaches will both consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configurations for the NB and SB approaches will remain in place following the construction of the University Line BRT Project.
    - Proposed BRT will operate traveling through the intersection along with the adjacent EB/WB through movements.

- 183: Tidwell Road at Jensen Drive
    - One through lane will be removed on the EB, WB, and SB approaches to the intersection to accommodate the proposed BRT guideway. The EB approach will consist of one exclusive left turn lane and one shared through / right turn lane. The WB approach will consist of one exclusive left turn lane and one shared through / right turn lane. The SB approach will consist of one exclusive left turn lane and one shared through / right turn lane.
    - The lane configurations for the NB approach will remain in place following the construction of the University Line BRT Project.
    - An exclusive BRT phase will be added to the intersection with all other traffic stopping since this is an intersection where the BRT vehicles will turn from one roadway to another. During this phase, the BRT will make the SB left turn movement and/or the WB right turn movement.

- 705: Jensen Drive at Turner Drive
    - Traffic signal to be installed at this intersection.
    - The proposed NB approach will consist of a shared left / through lane and a shared through / right turn lane.
    - The proposed SB approach will consist of one exclusive left turn lane and one shared through / right turn lane.
    - The proposed EB and WB approaches will have one lane for all traffic movements.
    - An exclusive BRT phase will be added to the intersection with all other traffic stopping since this is an intersection where the BRT vehicles will turn from one roadway to another. During this phase, the BRT will make the NB right turn movement and/or the WB right turn movement.

- 690: Epsom Road, Edell Street at Turner Drive
    - Traffic signal to be installed at this intersection.
    - All approaches to the intersection will have only one lane for all movements. The WB approach will only be used by BRT vehicles.
    - An exclusive BRT phase will be added to the intersection with all other traffic stopping since this is an intersection where the BRT vehicles will turn from one roadway to another.

8.5.2 Segment 5 Traffic Demand Adjustments

As discussed in further detail in section 3.2.1 of this report, a reduction of through traffic on Lockwood Drive of 10% was assumed following the opening of the proposed University Line BRT due to the reduction in capacity on this roadway and the availability of parallel routes with excess capacity. Long range travel demand modeling was performed both with and without the proposed University Line BRT Project in place, which showed that a portion of the through traffic on Lockwood Drive would shift to either Hirsch Road or Wayside Drive within the limits of Segment 5.

8.5.3 Segment 5 2030 Build Traffic Analysis Results

Table 29 shows the results of the traffic analysis which was performed for the AM and PM peak hours at each of the intersections within the study area of Segment 5 for the 2030 Build conditions. The table also includes the 2030 No-Build traffic analysis results for a comparison to the 2030 Build conditions.

Table 29: 2030 Build Conditions LOS Analysis Results – Segment 5

There is one intersection located within Segment 5 which is projected to operate at an overall LOS of D or better during the peak hours for the No-Build conditions, but due to the changes from the University Line BRT Project, it will operate at a LOS of F in the Build condition and includes:

- 183 – Tidwell Road at Jensen Drive (PM peak)

All other intersections in Segment 5 are projected to operate at a LOS of D or better during the peak hours after the proposed University Line BRT is in operation.

8.6 Short-Term Construction Impacts on Traffic

Construction of the Build Conditions will likely result in temporary disruptions or changes to transit, vehicular, and pedestrian and bicycle traffic patterns in the vicinity of the work areas. As the construction activities include full reconstruction of existing roadways and pedestrian facility improvements between the edge of roadways and rights-of-way, temporary closures of roadways, traffic lanes, sidewalks and hike/bike trails are anticipated. These temporary closures are needed to enable construction activities, to maintain work area access and to provide for public and worker safety during construction.

All modes of traffic are impacted where temporary roadway or lane closures are required. Where roadway closures are necessary, temporary detours will be needed to provide reasonable alternative routes for transit services and vehicles. If needed, pedestrian and bike traffic will also need to be re-routed to alternative streets that have adequate pedestrian and bike facilities. In particular, access for the Harrisburg Hike and Bike Trail at its Lockwood Drive crossing and the Columbia Tap Hike and Bike Trail at the crossing on Elgin Street will need to be considered. For transit services, METRO may consider temporary schedule adjustments and bus stop relocations to accommodate its customers and the public. Where lane closures are needed, transit services and vehicles may still be able to use the roadways adjacent to the work areas but at reduced speeds and capacity. Additionally, pedestrian and bike traffic may still be able to be maintained on their current routes with some temporary modifications made to the existing facilities. METRO will ensure that all pedestrian and bicycle detours and adjustments are safe and meet all applicable accessibility standards.

Potential impacts due to construction of proposed grade-separated structures as part of the Project may restrict transit, vehicular, pedestrian and bicycle movements for both short-term and mid-range timeframes. Potential impacts would include:

- Temporary closures and detours for placement of bridge beams and pouring bridge decks over roadway sections, including:
    - Sam Houston Tollway main lanes and frontage roads
    - Ranchester Drive
    - Gessner Road
    - Clinton Drive
    - Shreveport Boulevard
    - Bennington Street
    - Hirsch Road
- Temporary closures and detours for placement of underpass at UPRR crossing along Lockwood Drive between McKinney Street and Harrisburg Boulevard.
- Shifting of transit, vehicular and pedestrian traffic and reducing travel lanes to allow for adjacent bridge, underpass and roadway construction along Lockwood Drive at various UPRR crossings, at Clinton Drive, at Shreveport Boulevard and at Bennington Street and along Tidwell Road at the UPRR crossing near Hirsch Road.

8.6.1 Construction Impact Mitigation Strategies

Certain mitigation strategies should be considered to minimize construction impacts to traffic. The following potential construction phase mitigation strategies are based upon information included in the preliminary engineering documents. Final mitigation measures will be established by METRO in coordination with COH, TxDOT, HCTRA and other agencies, stakeholders and the public as the design progresses. The recommended preliminary mitigation strategies are summarized below:

- Develop, maintain and share a construction schedule with impacted agencies, stakeholders, and the public that includes:
    - Timing and locations of proposed roadway and lane closures, detours, alternative routes and other construction phase details that would assist mobility for residents, businesses and others living, working and traveling within the work area.
    - Timing and locations of other coordinated construction projects within the work area.
- Prior to construction, METRO to develop traffic control plans that provide for the safe handling of transit, vehicular, pedestrian and bike traffic within and adjacent to the Project boundaries that minimize impacts to traffic conditions. Such traffic control plans shall describe construction phasing, temporary roadway and lane closures, detours, warning devices and traffic control measures in forms that are acceptable to COH, TxDOT, HCTRA and any other governing agency.
- Prior to construction, identify acceptable hauling routes and incorporate into traffic control plans.

- Prior to construction, phase construction activities and closures to avoid overlap with major events, such as the University of Houston's Centennial Celebration (2027).
- Prior to and during construction, METRO to promote awareness of traffic arrangements with local officials, media and the public of the construction activities via media alerts, social media updates, mailings, newspapers, magazines, advanced message signs and any other impactful news outlet.
- During construction, METRO to coordinate with property owners to manage and maintain access to businesses and residences within work areas.
- During construction, strictly adhere to Union Pacific Railroad requirements at all rail crossings.
- Limit temporary closures and detours for placement of bridge beams and pouring bridge decks over roadway sections to nighttime periods only.
- Limit short-term full closures to nighttime hours or non-peak periods.

8.7 Parking Impacts

With the BRT lanes and facilities being proposed along existing streets currently designated as either Major Thoroughfares, Major Collectors or Transit Corridors per the City of Houston's 2022 Major Thoroughfare and Freeway Plan, the Project will result in minimal loss of on-street parking as the majority of the streets do not allow on-street parking due to higher speeds, traffic volumes and safety. Restrictions to street parking is typically identified with "No Parking" signage along the streets. Additionally, Texas state law and local ordinances prohibit parking along streets within certain distances from existing intersections, driveways and fire hydrants among other things. As the Project is located within an urban environment, these restrictions alone prohibit on-street parking for the majority of the alignment.

On-street parking has been identified and is allowed in a couple of areas within Segment 3 only. Currently, Wheeler Avenue between Caroline Street and Ennis Street and Ennis Street between Barbee Street and Elgin Street allows on-street parking with either time restrictions limiting parking to non-peak periods or Sundays or with no restrictions. The total distance of this on-street parking is approximately 1.6 miles with its location being primarily residential with parking in front of homes. It is noted that the on-street parking appears to be more for convenience as the adjacent properties have existing driveways or parking lots with adequate room for more than one vehicle.

9 Traffic Safety Analysis

An evaluation of the existing safety conditions was performed using historical crash data from the TxDOT Crash Records Information System (CRIS) database. CRIS data includes specific information for all reported crashes including location, date, time, crash severity, crash type, and various roadway and environmental factors. Crash data from 2017 to 2019 was obtained and reviewed. Crash data does include pedestrian and bike crashes in addition to vehicular crashes. Crashes were summarized into severity and type for the entire corridor and by segment. Crash rates were also estimated and compared to the historical statewide average crash rates, obtained from TxDOT, for urban and 4-lane divided roadways. Crash rates were calculated per 100 Million Vehicle Miles Traveled (VMT).

9.1 Corridor-Wide Safety Analysis

Review of the crash data showed there was a total of 2,044 reported crashes along the corridor between 2017 and 2019. The crash rates for the entire corridor were higher than the respective statewide average for each of the years analyzed. **Table 30** shows the corridor crash rates compared to the statewide average for urban state highways.

Table 30: Corridor Crash Rates 2017 - 2019

Year	Crashes	Length (Miles)	AADT*	Crash Rate (Crashes per 100M VMT)	Statewide Average Crash Rate (Crashes Per 100M VMT)
2017	659	24.65	19,143	382.61	160.94
2018	670	24.65	19,393	383.98	156.71
2019	715	24.65	20,240	392.61	155.98

**AADT calculated as a weighted average of available AADT in TxDOT's Statewide Traffic Analysis and Reporting System (STARS)*

The crash rate along the proposed BRT route between 2017 and 2019 has been higher than the statewide average for urban divided roadways with four or more lanes, which applies to all streets along which the BRT will run. The crashes which were reported in the study area were further classified by type as indicated in **Table 31.**

Table 31: Corridor Crash Types 2017 - 2019

Year	One Vehicle	Opposite Direction	Same Direction	Angle	Other	Total
2017	81	95	254	228	1	659
2018	75	96	267	231	1	670
2019	90	100	297	227	1	715
Total	**246**	**291**	**818**	**686**	**3**	**2,044**
%	**12.0%**	**14.2%**	**40.0%**	**33.6%**	**0.2%**	**100.0%**

From 2017 to 2019, a total of 51 crashes resulted in serious injuries or fatalities, while other crashes were reported as having non-incapacitating injury, possible injury, or property damage only. **Table 32** lists the corridor crash severity.

Table 32: Corridor Crash Severity 2017 - 2019

Year	Possible Injury	Non-Incapacitating Injury	Serious Injury	Fatality	Property Damage Only	Other	Total
2017	154	57	11	5	417	15	659
2018	150	61	14	1	425	19	670
2019	168	62	18	2	451	14	715
Total	**472**	**180**	**43**	**8**	**1,293**	**48**	**2,044**
%	**23.1%**	**8.8%**	**2.1%**	**0.4%**	**63.3%**	**2.3%**	**100.0%**

9.2 Segment 1 Safety Analysis

A total of 412 crashes were reported within Segment 1 between 2017 and 2019. A shown in **Table 33**, the crash rates for Segment 1 were higher than the respective statewide crash rates for each of the years analyzed, except 2017. For this segment, the statewide average used was for urban state highways.

Table 33: Segment 1 Corridor Crash Rates 2017 - 2019

Year	Crashes	Length (Miles)	AADT*	Crash Rate (Crashes per 100M VMT)	Statewide Average Crash Rate (Crashes Per 100M VMT)
2017	115	6.63	35,515	133.81	160.94
2018	140	6.63	36,189	159.86	156.71
2019	157	6.63	36,877	175.93	155.98

**AADT calculated as a weighted average of available AADT in TxDOT's Statewide Traffic Analysis and Reporting System (STARS)*

Crash locations also were plotted using GIS and a heat map depicting these locations along Segment 1 for years 2017 through 2019 is shown in **Figure 35**. The intersections of Westpark Drive with Chimney Rock Road and South Rice Avenue were two of the existing crash hot spots located within Segment 1.

Figure 35: Segment 1 Crash Location

Table 34 shows the breakdown of crash types were reported within Segment 1 between 2017 and 2019.

Table 34: Segment 1 Crash Types 2017 - 2019

Year	One Vehicle	Opposite Direction	Same Direction	Angle	Other	Total
2017	9	20	57	29	0	115

9.3 Segment 2 Safety Analysis

A total of 480 crashes were reported along Segment 2 between 2017 and 2019. As shown in **Table 36**, the crash rates for the segment were higher than the respective statewide crash rates for each of the years analyzed. For this segment, the statewide average was for urban 4-lane divided highways.

Table 36: Segment 2 Corridor Crash Rates 2017 - 2019

Year	Crashes	Length (Miles)	AADT*	Crash Rate (Crashes per 100M VMT)	Statewide Average Crash Rate (Crashes Per 100M VMT)
2017	181	4.26	20,851	558.27	160.94
2018	155	4.26	21,081	472.87	156.71
2019	144	4.26	21,313	434.53	155.98

**AADT calculated as a weighted average of available AADT in TxDOT's Statewide Traffic Analysis and Reporting System (STARS)*

Crash locations also were plotted using GIS and a heat map depicting these locations along Segment 2 for years 2017 through 2019 is shown in **Figure 36**. The intersections of Richmond Avenue with Montrose Boulevard and Kirby Drive were two of the existing crash hot spots along this segment.

Figure 36: Segment 2 Crash Location

9.4 Segment 3 Safety Analysis

A total of 373 crashes were reported along Segment 3 between 2017 and 2019. As shown in **Table 39**, the crash rates for the segment were greater that the respective statewide crash rates for each of the years analyzed. For this segment, the statewide average used was for urban 4-lane divided roadways.

Table 39: Segment 3 Corridor Crash Rates 2017 - 2019

Year	Crashes	Length (Miles)	AADT*	Crash Rate (Crashes per 100M VMT)	Statewide Average Crash Rate (Crashes Per 100M VMT)
2017	124	3.45	7,282	1,352.3	170.06
2018	110	3.45	7,347	1,188.9	165.63
2019	139	3.45	7,414	1,488.9	169.99

**AADT calculated as a weighted average of available AADT in TxDOT's Statewide Traffic Analysis and Reporting System (STARS)*

Crash locations also were plotted using GIS and a heat map depicting these locations along Segment 3 for years 2017 through 2019 is shown in **Figure 37**. The intersections of Wheeler Avenue in the area of intersections with Main Street, Fannin Street, and San Jacinto Street were a

hot spot for crashes in this segment. Another hot spot is the intersections along Elgin Street between Ennis Street and IH-45.

Figure 37: Segment 3 Crash Location

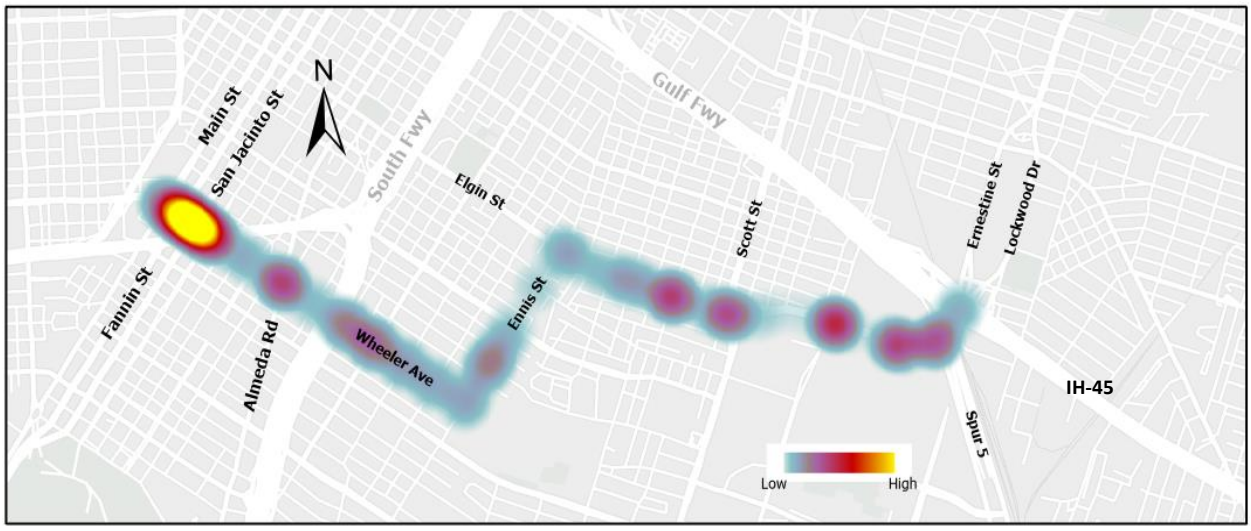

Table 40 shows the breakdown of crash types which were reported within Segment 3 between 2017 and 2019.

Table 40: Segment 2 Crash Types 2017 - 2019

9.5 Segment 4 Safety Analysis

A total of 164 crashes were reported along Segment 4 between 2017 and 2019. As shown in **Table 42**, the crash rates for the segment were higher than the respective statewide crash rates for each of the years analyzed. For this segment, the statewide average used was for urban 4-lane divided highways.

Table 42: Segment 4 Corridor Crash Rates 2017 - 2019

Year	Crashes	Length (Miles)	AADT*	Crash Rate (Crashes per 100M VMT)	Statewide Average Crash Rate (Crashes Per 100M VMT)
2017	58	2.94	13,924	388.05	160.94
2018	51	2.94	13,979	339.86	156.71
2019	55	2.94	14,036	365.04	155.98

**AADT calculated as a weighted average of available AADT in TxDOT's Statewide Traffic Analysis and Reporting System (STARS)*

Crash locations also were plotted using GIS and a heat map depicting these locations along Segment 4 for years 2017 through 2019 is shown in **Figure 38**. The intersections of Lockwood Drive with Clinton Drive and Navigation Boulevard were a few crash hot spots for this segment.

Figure 38: Segment 4 Crash Location

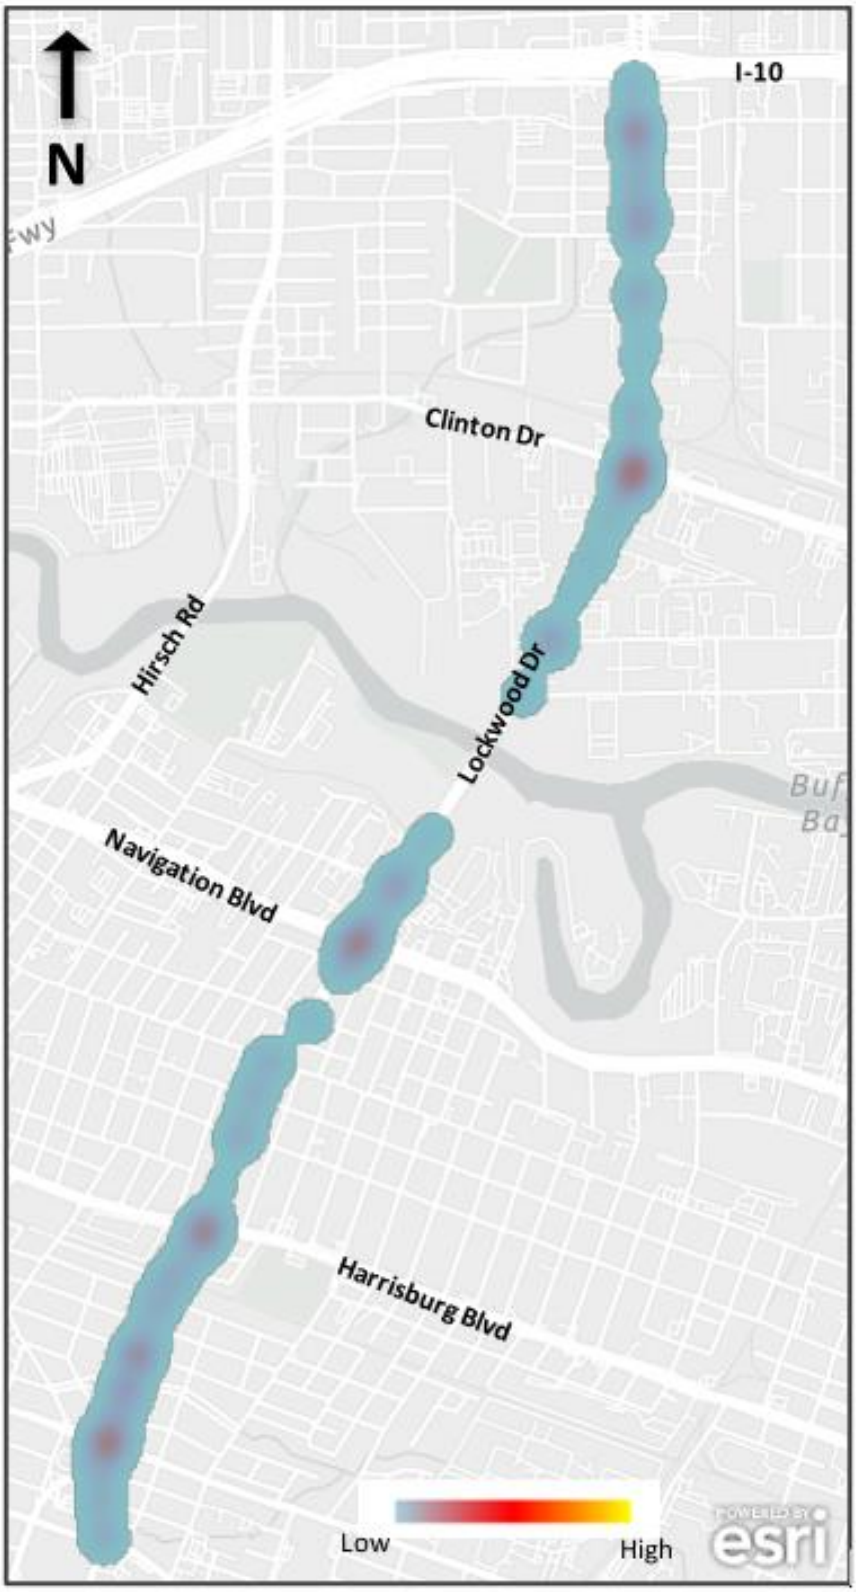

Table 43 shows the breakdown of crash types which were reported within Segment 4 between 2017 and 2019.

9.6 Segment 5 Safety Analysis

A total of 615 crashes were reported along Segment 5 between 2017 and 2019. As shown in **Table 45**, the crash rates for the segment were higher that the respective statewide crash rates for each of the years analyzed. For this segment, the statewide average used was for urban 4-lane divided highways.

Table 45: Segment 5 Corridor Crash Rates 2017 - 2019

Year	Crashes	Length (Miles)	AADT*	Crash Rate (Crashes per 100M VMT)	Statewide Average Crash Rate (Crashes Per 100M VMT)
2017	181	7.37	11,061	608.29	160.94
2018	214	7.37	11,106	716.30	156.71
2019	220	7.37	13,134	622.67	155.98

**AADT calculated as a weighted average of available AADT in TxDOT's Statewide Traffic Analysis and Reporting System (STARS)*

Crash locations also were plotted using GIS and a heat map depicting these locations along Segment 5 for years 2017 through 2019 is shown in **Figure 39**. The intersections of Lockwood Drive with Kelley Street and Lyons Avenue and the intersection of Tidwell Road and Jensen Drive were a few crash hot spots in this segment.

Figure 39: Segment 5 Crash Location

Table 46 shows the breakdown of crash types which were reported within Segment 5 between 2017 and 2019.

9.7 Projected Safety Benefits

The proposed University Line BRT Project will include provisions that will improve safety of the corridors on which the BRT will run. Safety for all modes of transportation including vehicular traffic, users of the proposed BRT, and pedestrians will be improved as a result of the University Line BRT Project. Further details for each mode are discussed in the following sub-sections.

9.7.1 Vehicular Safety Enhancements

The proposed Project will improve safety along the proposed route for vehicular traffic through the entire corridor. The primary mechanism which will improve safety will be implementation of access management and reduction in conflict points along the routes. Conflict points are locations where traffic either merges, diverges, or crosses. A standard 4-approach intersection contains a total of 32 conflict points. Conflict points also exist at each driveway entrance to and from main roadways. The number of conflict points will be reduced throughout the proposed BRT corridor since the proposed center running BRT will serve as a raised median that will prohibit uncontrolled movements across the street and will require controlled access. Left turns from or onto the proposed route will only be allowed at the signalized intersections along the University Corridor. The proposed improvements are not projected to significantly affect vehicular speeds along the corridors which are relatively low.

The TxDOT Access Management Manual summarizes the numerous studies which have been performed across the United States for undivided, Two Way Left Turn Lane (TWLTL), and Non-Traversable medians. Roadways with a non-traversable (raised) median have on average a 30% lower crash rate that those with no median or a TWLTL. **Table 48** below shows how the type of median and number of conflict points affects crash rates.

Table 48: Crash Rates per Median Type and Conflict Point Density

Representative Crash Rates (per 1 Million VMT) By Median Type and Conflict Point Density – Urban and Suburban Areas			
Access Points per Mile	Median Type		
	Undivided	TWLTL	Non-Traversable Median
< 20	3.8	3.4	2.9
20 – 40	7.3	5.9	5.1
40 – 60	9.4	7.9	6.8
> 60	10.6	9.2	5.6

Source: TxDOT Access Management Manual – July 1, 2011

Crash rates are a function of both the number of access points and the type of median which is present on a roadway. The proposed University Line BRT Project will reduce the number of conflict points throughout the proposed BRT corridor and provide a non-traversable median which can be expected to reduce the crash rate throughout the corridor.

A summary of the impacts on conflict points for each segment is listed below.

Segment 1

Westpark Drive between IH-610 and Edloe street currently has an existing two way left turn lane which will be removed and replaced with the proposed BRT Guideway. This will prohibit left turns to and from Westpark Drive at locations other than the signalized intersections. There are numerous driveways which will become right-in/right-out only entrances which would reduce the number of conflict points.

Segment 2

Approximately 27 unsignalized median openings along Richmond Avenue between Edloe Street and Main Street will be closed as part of the proposed University Line BRT Project. The side-streets or entrances at these locations will be converted to right-in/right-out only approaches to Richmond Avenue.

Segment 3

Wheeler Avenue is currently a four-lane undivided roadway between Main Street and Ennis Street. The proposed BRT guideway will act as a raised median on this roadway, which would make all entrances to the roadway in this area right-in/right-out only. Left turns to and from Wheeler Avenue will be restricted and will only be allowed at the signalized intersections on Wheeler Avenue.

There are also several intersections on Wheeler Avenue where exclusive left turn lanes do not exist for permitted left turns and causes vehicles to wait for a gap in oncoming traffic within an existing travel lane, which increases the chances of rear end collisions. Left turn lanes are proposed at all intersections on Wheeler Avenue except for La Branch Street where left turns will be prohibited from Wheeler Avenue.

Ennis Street is also currently a four-lane undivided roadway between Wheeler Avenue and Elgin Street. The proposed BRT guideway will act as a raised median on this roadway, which will make all entrances to the roadway in this area right-in/right-out only. Left turns to and from Wheeler Avenue will be controlled and will only be allowed at the signalized intersections on Ennis Street. Split phasing and exclusive BRT phases will be used at these intersections as there is not adequate room on this street to provide exclusive left turn lanes.

Approximately 13 unsignalized median openings along Elgin Street between Ennis Street and the NB IH-45 Frontage Road will be closed as part of the proposed University Line BRT Project. The side streets or entrances at these locations will be converted to right in / right out only approaches to Elgin Street.

Segment 4

Currently Lockwood Drive and Ernestine Street are a one-way pair between the IH-45 NB Frontage Road and Polk Street. As part of the proposed University Line BRT Project and in coordination with COH, both Lockwood Drive and Ernestine Street will be converted to two-way traffic. This change was necessary to maintain safe access to the existing developments between these two roadways

once the proposed University Line BRT is constructed. The proposed BRT guideway will run along Lockwood Drive as a center running BRT which will provide the access management benefits as in other areas of the corridor such as controlling left turns to and from Lockwood Drive and reducing the number of conflict points.

To the north of Polk Street, approximately 37 unsignalized median openings along Lockwood Drive will be closed within Segment 4, as part of the proposed University Line BRT Project. The side streets or entrances at these locations will be converted to right-in/right-out only approaches to Lockwood Drive.

Segment 5

Approximately 37 unsignalized median openings along Lockwood Drive will be closed within Segment 5 as part of the proposed University Line BRT Project. The side streets or entrances at these locations will be converted to right-in/right-out only approaches to Lockwood Drive. An additional 17 unsignalized median openings will be closed along Tidwell Road.

9.7.2 Transit Users Safety Enhancements

All crossings to the proposed stations for the University Line BRT Project will occur at either signalized intersections or signalized midblock crossings providing controlled access for pedestrians to and from the proposed stations. Pedestrian refuge areas and Z-crossings have been provided in the geometric design where median width and design context allows. The transit vehicles will also travel through the majority of the corridor without any conflicting vehicle paths. There is one area at the interchange of Elgin Street with Spur 5 and IH-45 where the BRT vehicles will operate in mixed traffic. At this interchange, BRT vehicles will be provided with a queue jump in both directions so they can access the intersection in advance of the general-purpose traffic and will not have to yield to any traffic within the intersection.

9.7.3 Pedestrian and Bicyclist Safety Enhancements

The University Corridor BRT Project will provide a safe, reliable walkable environment along the corridor that meets the intent of the City of Houston's Transit-Oriented Development (TOD) policies and conforms to its requirements. The main component of the TOD is the pedestrian realm, which is the area between the back of curb or edge of pavement and the Right-of-Way (ROW). The pedestrian realm includes an unobstructed sidewalk or sidepath and a safety buffer area. There is also a frontage buffer that is typically provided between the sidewalk or sidepath and the ROW. The safety buffer area is an important element that shields the sidewalk or sidepath from the street and can include a combination of landscaping, utilities and sidewalk amenities, such as street furniture, bike racks and decorative plantings.

As the majority of the University Corridor is within City of Houston ROW of various widths and extends through different area types, including neighborhoods, businesses and universities, the pedestrian realm dimensions will also vary to remain sensitive to the area's local context and to minimize impacts to the ROW. Ideally, the pedestrian realm would have a total minimum width of 16 feet with a 4-ft. safety buffer, 10-ft. sidepath and a 2-ft. frontage buffer.

However, as mentioned previously, the pedestrian realm dimensions vary throughout the University Corridor with the safety buffers ranging from 2 feet to 4 feet, sidewalks ranging from 5 feet to 8 feet, sidepaths with 8-ft and 10-ft widths, and frontage buffers with a minimum width of 1 foot. The larger pedestrian realms are located in Segments 1, 4 and 5, while Segments 2 and 3 would have the smaller pedestrian realms.

Through continued coordination with COH, METRO plans to align the University Corridor bike improvements with the Houston Bike Plan to the extent possible. The Houston Bike Plan identifies the network of existing, planned and proposed bikeways on-street and off-street and within dedicated lanes or shared lanes for the entire City limits. The University Corridor alignment seeks to accommodate the City's current and future bike network by maximizing the pedestrian realm space and providing 8-ft or 10-ft sidepaths, which are to be shared by both pedestrians and bicycle users, where feasible and with minimum impacts to ROW. The intent is to have bicycles operating off-street along the University Corridor alignment. At no time will bicycles operate with BRT lanes.

It is noted that the Houston Bike Plan does not identify existing, planned or proposed bikeways for the entire length of the University Corridor. There are a number of sections along the alignment that do not have bikeways. Segments 1, 4 and 5 contain the majority of the bikeways, while Segments 2 and 3 have minor bikeway distances along the alignment. The below table identifies the locations of the bikeways included on the Houston Bike Plan that overlap with the University Corridor and the preliminary accommodations proposed as part of the Project:

Table 49: Bike Lanes

SEGMENT	STREET	FROM	TO	DISTANCE	ACCOMMDATIONS
1	Westpark ROW	Westchase Park & Ride	IH-610	6.3 miles	10-ft sidepath; off-street
1	Westpark	IH-610	Edloe	1.5 miles	10-ft sidepath; off-street
2	Richmond	Edloe	Wakeforest	0.7 miles	8-ft sidepath; off-street
3	Wheeler	Emancipation	Ennis	0.4 miles	None; on-street or use parallel street
3	Elgin	Cullen	Spur 5	0.4 miles	10-ft sidepath; off-street
4	Lockwood	IH-45	Clinton	2.7 miles	10-ft sidepath; off-street
4	Lockwood	Clinton	Margarita	0.5 miles	8-ft sidepath; off-street
5	Lockwood	Margarita	IH-10	0.3 miles	8-ft sidepath; off-street
5	Lockwood	IH-10	IH-610	2.4 miles	10-ft sidepath; off-street
5	Lockwood	IH-610	Kelley	0.3 miles	8-ft sidepath; off-street
5	Tidwell	Lockwood	Jensen	1.4 miles	8-ft sidepath; off-street
5	Jensen	Tidwell	Turner	0.1 miles	8-ft sidepath; off-street

Over half of the University Corridor length will have 10-ft off-street sidepaths to accommodate both pedestrians and bicyclists. For those areas with 8-ft sidepaths and on-street bikeways, final pedestrian and bicyclist safety enhancements will continue to be coordinated with COH, stakeholders and the public as the design progresses.

APPENDIX B – BACKGROUND PROJECTS INCLUDED IN THE TDM

Sponsor	Category	Segment	Description	Est. Construction Start Date
TxDOT	Highway	1	Upgrades include wider connectors, additional shoulders, increased vertical clearances and sight distances, additional detention ponds, and reduced weaving.	2017
Uptown Houston District	Local Street	1	Expansion from 4 to 6 lanes from Westheimer to I-69/US-59.	2027
Uptown Houston District	Local Street	1	Expansion from 6 to 8 lanes from Sage Rd to Chimney Rock Rd.	2027
METRO	Transit	1	New BRT busway from Missouri City P&R to Willowbrook Mall via Gessner; includes 40 stations.	2045
METRO	Transit	1	New transit center at Bellaire Blvd and Chimney Rock Rd to replace existing transit center at Bellaire and S Rice Ave.	2045
METRO	Transit	1	5.2-mile extension of Silver Line from Bellaire/Uptown Transit Center south to new Gulfton Transit Center; includes 3 stations.	2030
H-GAC	Highway	2	Convert existing 1-lane HOV facility to 2-lanes from Spur 527 to Beltway 8.	2040
Montrose TIRZ	Street	2	Reconstruct Montrose Blvd into a 4-lane roadway with a new storm sewer system that will provide additional in-line detention, wide pedestrian-friendly sidewalks, sidewalks on both sides, and replacement of public utilities; in partnership with METRO.	N/A
TxDOT	Highway	3	Reconstruct and widen I-69/US-59 from 6 to 10 main lanes between Spur 527 and SH-288.	2022
TxDOT	Highway	3	Reconstruct and widen I-69/US-59 from 8 to 12 main lanes and reconstruct I-69/SH-288 interchange.	2021
OST/Almeda TIRZ	Park	3	Add new outdoor performance stage and event lawn, construct public parking garage at Elgin St and Emancipation Ave, and enhance park facilities, infrastructure, splash pads and other park amenities as needed.	2020
Midtown TIRZ	Park	3	Create new park above I-69/US-59 following completion of NHHIP.	2023
University of Houston	Transit	3	Construct multimodal transportation center for UH at Wheeler Ave and Calhoun Rd.	2027
METRO	Transit	3	Replace Wheeler Station with new Wheeler Intermodal Terminal.	2024
Harris County	Facility	4	Construction of a parking lot facility at 701 Lockwood Dr, including access road, sidewalks, drainage, and a potential traffic signal.	2022
H-GAC	Highway	4	New 2-lane HOV facility on I-10 from I-610 to Garth Rd, including in-freeway bus station at Fifth Ward/Denver Harbor TC.	2040
H-GAC	Highway	5	Conversion of existing one-way reversible HOV lane to two-way all-day facility from Downtown to Townsen Park & Ride.	2040
